基于端口的虚拟主机

```
1 | $ mkdir /var/www/web1
   $ vim /var/www/web1/index.html
   $ vim /etc/httpd/conf/httpd.conf
4 # 添加如下内容
 5 Listen 81
6 <VirtualHost *:81>
      DocumentRoot /var/www/web1
7
       ServerName
                   www.web1.com
9
   </VirtualHost>
10
11 | $ systemctl restart httpd
12 # 访问测试
13 $ curl 192.168.194.174:81
```

基于IP地址的虚拟主机

```
1 $ ifconfig ens34:1 192.168.194.191 (临时增加IP)
   $ nmcli connection modify ens34 +ipv4.addresses 192.168.194.191/24
   $ nmcli connection up ens34 (永久增加IP地址)
   # 选择1种添加IP即可
 6
7
   $ mkdir /var/www/web2
8
   $ vim /var/www/web2/index.html
   $ vim /etc/httpd/conf/httpd.conf
10 # 添加如下内容
11 <VirtualHost 192.168.194.191:80>
      DocumentRoot /var/www/web2
12
13
      ServerName www.web2.com
14 </VirtualHost>
15
   $ systemctl restart httpd
16 # 访问测试
17 | $ curl 192.168.194.191
```

基于域名的虚拟主机

```
1 | $ mkdir /var/www/web3
   $ vim /var/www/web3/index.html
   $ vim /etc/httpd/conf/httpd.conf
4 # 添加如下内容
5
   <VirtualHost *:80>
6
      DocumentRoot /var/www/web3
7
      ServerName www.web3.com
   </VirtualHost>
9
  $ systemctl restart httpd
10 | $ vim /etc/hosts
11 # 添加如下内容,完成你的域名的解析
12 192.168.194.174 www.web3.com
   # 访问测试
13
   $ curl www.web3.com
```
